                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                              The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linksed in the parent polypeptide to imped, abrogate or otherwise alter at least one function associated with the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polypeptides. The synthetic polypeptides and a computer system for designing the synthetic polypeptides. The synthetic polypeptides and polymucleotides or are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breat, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, cospophagus, brain, testicle, uterus), as potentiating agents.

Compositions comprising the polypeptide may be used in the treatment or prophylaxis against virus (such as infections caused by HIV (human immunodeficiency virus), hepstitis, influenza, Japanese encephalitis virus, Epstein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, C. (e.g., infections caused by Plasmodium, Schistosoma, Leishmania, Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a human MAGE-A1 HLA (human leukocyte antigen) class II-binding protein. Peptides derived from the MAGE-A1 HLA binding protein atimulate the activity and proliferation of CD4+ T lymphocytes. The MAGE-A1 HLA binding protein is useful as a diagnostic agent for diagnosing a disorder characterized by expression of MAGE-A1. The protein is used for treating a disorder characterized by expression of MAGE-A1 such as cancers e.g. melanomal, squamous cell carcinomas, colorectal carcinomas, osteosarcomas, and lymphocytic leukemias. Peptides derived from the MAGE-A1 HLA binding protein are useful in the production of anti-tumour vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 to and

expressed in a variety of tumours and in normal testis cells, but not by other normal cells. The invention provides MACE-C1 and MACE-C2 nucleic acids and polypeptides, useful e.g. in a claimed method for determining the presence of cytolytic T cells specific for complexes of a human leukocyte antigen (HLA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel MAGE-A1 human leukocyte antigen class II peptides which bind to are presented to the class II molecules, useful for inducing immune response and treating cancers characterized by expression of MAGE-A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Van Der Bruggen P;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to functional variants and isolated mimetics of a MAGE-A1 human leukocyte antigen (HLA)-B35 or HLA-B44 binding peptide, or of a MAGE-A1 HLA-B35 binding peptide, identified by methods described in the specification. MAGE genes encode tumour rejection antigens (TRAs) presented to T lymphocytes by HLA-B35 and HLA-B44 molecules. The MAGE antigenic peptide acts by binding to HLA molecules on tumour cells and stimulating recognition of these cells and thus signalling them to the induces the activation and stimulation of CD8+ cytocoxic T lymphocytes. The MAGE antigenic peptide is used to treat and diagnose disorders characterised by expression of MAGE-A1 or -A3. Disorders include cancers erg melanomas, ossophageal, lung, head and neck, breast, colorectal, prostate, renal, bladder, hepatccellular, papillary thyroid and gastric carcinomas, myelomas, brain tumours, sarcomas, seminomas, and ovarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Functional variants and isolated mimetics of a MAGE-Al HLA-B35 or HLA-B44 binding peptide, used in diagnosis and treatment of a disorder characterized by expression of MAGE
MAGE antigenic peptide; Human leukocyte antigen; HLA-B35; HLA-B44; tumour cell; immunostimulant; antigen presentation; cancer; melanoma; CD8+ cytotoxic T lymphocyte; colorectal; prostate; gastric carcinoma; myeloma; brain tumour; sarcoma; seminoma; ovarian tumour; cytostatic; gene therapy; human; MAGE-A1; tumour rejection antigen; TRA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

```
The invention relates to a new synthetic polypeptide (I) comprising several different segments of at least one parent polypeptide linked together in a different relationship relative to their linked elements of a different relationship relative to their linked in the parent polypeptide and in the parent polypeptide and for inducing an immune response against a pathogen or cancer. Also included are a synthetic polypeptides. The synthetic polypeptides and polymotleotides or synthetic polypeptides. The synthetic polypeptides and polymotleotides or are referred to as a Savine. The synthetic polypeptide is useful for modulating immune responses preferably directed against a pathogen or a cancer, (e.g., cancers of the lung, breat, ovary, cervix, colon, head and neck, pancreas, prostate, stomach, bladder, kidney, bone liver, cospopagus, brain, testicle, uterus), as potentiating agents.

Compositions comprising the polypeptide may be used in the treatment or prophylaxis against virus and respiratory and respiratory syncytial virus), bacterial (e.g., infections caused by Neisseria, Meningococcal, Haemophilus, cvirus, Epstein-Barr virus and respiratory syncytial virus), bacterial (e.g., infections caused by Plasmodium, Schistosoma, Leishmania, Trypanosoma, Toxoplasma and Giardia) infections. The present sequence is comparion.
                                                                                                                                                                                                                                                                                                                                                                                       New synthetic polypeptides having several different segments of at least one parent polypeptide linked together differently compared to the linkage in the parent polypeptide, for inducing immune response against a

The present invention describes an isolated epitope (I) and an epitope cluster. Also described is a vaccine or immunotherapeutic composition (VC) comprising (I). (I) has cytostatic activity. VC is useful for treating an animal, by administraing to an animal the vaccine or immunotherapeutic composition. VC is also useful for evaluating immunotherapeutic composition. VC is also useful for evaluating composition. VC is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic composition, by administering VC to an HLA-transgenic animal and evaluating immunogenicity based on a characteristic of the animal, or by in vitro immunogenicity based on a characteristic of the animal, or by in vitro primary stimulation of a T cell and evaluating immunogenicity. (I) is useful for determining specific T cell frequency, by contacting T cells with a MHC-peptide complex, and further comprises ELISPOT analysis, limiting dilution analysis, flow cytometry, in situ hybridisation and/or polymerase chain reaction (PCR). ABQ83843 to ABQ83858 and ABP74128 to ABP74131 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid molecule which encodes a tumour rejection antigen precursor (TRAP) having an amino acid sequence of a tumour rejection antigen precursor (TRAP) having an amino acid sequence of a TRAP encoded by a fully defined MAGE-G3, MAGE-B6, or MAGE-B6 polynuclectide sequence. Also disclosed is a method which is useful for determining presence of cytolytic T-cells specific for complexes of human cleukoryte antigen (HLM) and a peptide derived from the nucleic acid in a cytocoxic T-lymphocyte (CTL)-containing sample. The nucleic acid is useful as a diagnostic probe to determine the presence of abnormal cumour) cells such as seminoma, bladder transitional-cell carcinoma, head-and-neck squamous-cell carcinoma, breast carcinoma, sarcoma, cutaneous melanoma or nonsmall cell lung cancer (NSCLC) which express MAGE-G1, MAGE-B5 or MAGE-B6. The nucleic acid is useful for diagnosing a disorder characterised by expression of MAGE-C1, MAGE-B5 or MAGE-B6 TRAPS or tumour rejection antigens (TRAP). The present sequence represents the amino acid sequence of the human tumour rejection antigen precursor, MAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
TRAP; tumour rejection antigen precursor; cytolytic T-cell; CTL; tumour; seminoma; bladder transitional-cell carcinoma; NSCLC; adaptor; head-and-neck squamous-cell carcinoma; breast carcinoma; sarcoma; cutaneous melanoma; nonsmall cell lung cancer; MAGE-A1; human.

The invention relates to an isolated epitope polypeptide that has high affinity for major histocompatibility complex (MHC) class I, and an epitope cluster comprising the polypeptide. Also disclosed is a vaccine or immunotherapeutic composition containing an epitope of the invention. Compositions of the invention may be used in the treatment of cancer. The method can be combined with a radiation therapy, themotherapy, the corposition is also useful for evaluating immunogenicity of a vaccine or immunotherapeutic compound. Multimeric MHC repptide complexes of the invention are useful for determining specific T cell frequency. This method is useful for evaluating immunological invention step compositions to and subsequent to an diagnosition are useful for diagnosity and alsease. The current sequence represents an epitope of the invention are useful for invention with high affinity for MHC class I.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Stabilised mRNA, translation optimised, vaccine, tissue repair; sequence modification determination; gene therapy; cytostatic; virucide, antibacterial; protozoacide, nootropic, neuroprotective; infection; antiparkinsonian; immunostimulant; cancer; MAGEI protein.

```
The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, lymphoma or leukaemia. These are also useful for screening agents for treating the above mentioned diseases. This sequence represents an treating the above mentioned diseases. This sequence represents an profiling. Note: This sequence does not appear in the printed profiling appearing the above mentioned diseases on appear in the printed profile profile the profile of the polypeptide in electronic format directly from WIPO at
                                                                   New polypeptides (e.g. kinases, phosphatases, proteases, transporters, cytoskeletal proteins, receptors or transcription factors), useful for treating cancer, e.g. colon cancer, gastric cancer, sarcoma, lymphoma or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MAGE-1; CLYTA-MAGE-1-His; fusion protein; tumour; melanoma;

                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a pharmaceutical composition containing at least one modified RNA encoding a biologically active or antigenic protein. The RNA is modified to optimise translation of the sequence. The compositions are used for vaccination against a wide range of infectious diseases (viral, bacterial or protozoal) or cancer, or for tissue regeneration, e.g. in cases of Alzheimer's or Parkinson's diseases and arthritis, but also to express proteins such as dystrophins, chloride ion channels (for treating cystic fibrosis) and enzymes (either for treating metabolic disorders or for synthesis of neurotransmitters such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Translational profiling; expressed protein tag; EPT; kinase; phosphatase; protease; protease inhibitor; transporter; cytoskeletal protein; receptor; transcription factor; cancer; MHC; major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarcinoma; sarcoma; melanoma; lymphoma; leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                    Composition containing mRNA modified for optimal translation and stability, useful for treating e.g. tumors or infections, comprises increased G/C content and fewer rare codons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

```
New protein derivatives used in cancer vaccine therapy for treating a range of cancers including melanomas, carcinomas and cancers of breast.
```

Example 9; Page 69-70; 72pp; English.

The present sequence represents a fusion protein composed of the C-terminal portion of the Streptococcus pneumoniae LYTA protein (CLYTA), the human MAGE-1 tumour-associated antigen and a hexahistidine tail. A vector designed for recombinant expression of the fusion protein in Bscherichia coli is provided. The CLYTA moiety provides expression of soluble fusion protein, facilitates affinity purification, and also acts as a T-helper epitope. The invantion relates to MAGE proteins fused to an immunological fusion partner, e.g. CLYTA-MAGE-I-His. These novel fusion proteins provide vaccines for immunotherapy of melanomas or other MAGE-associated tumours like breast, bladder, lung and non-small cell lung cancer, head and squamous cell carcinoma, colon carcinoma and oesophagus carcinoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 49, Application US/08465167A

Sequence 49, Application US/08465167A

Patent No. 5750395

GENERAL INFORMATION:

APPLICANT: Livingston, Brian D.

APPLICANT: Sette, John C.

TITLE OF INVENTION: DNA ENCODING MAGE-1 C-TERMINAL

TITLE OF INVENTION: IMMUNOGENIC PEPTIDES (as amended)

NUMBER OF SEQUENCES: 51

CORRESPONDENCE ADDRESS:

ADDRESSEE: Townsend and Townsend and Crew LLP

STREET: Two Embarcadero Center, 8th Floor

CITY: San Francisco

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Analysis of the beta' subunit of DNA-dependent RNA polymerase does
not support the hypothesis inferred from 165 rRNA analysis that
Oenococcus oeni (formerly Leuconostoc oenos) is a tachytelic
(fast-evolving) bacterium.";
Int. J. Syst. Bacteriol. 46:1004-1009(1996).

-IFUNCTION: DNA-dependent RNA polymerase catalyzes the transcription
of DNA into RNA using the four ribonucleoside triphosphates as
                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  15-DEC-1998 (Rel. 37, Created)

DNA-directed RNA polymerase beta' chain (EC 2.7.7.6) (Transcriptase beta' chain) (RNA polymerase beta' subunit) (Fragment).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  - {NNA}(N).
-1- SUBUNIT: The enzyme consists of the sigma chain and the core enzyme which is composed of 2 alpha chains, 1 beta chain, beta' chain.
-1- SIMILARITY: Belongs to the RNA polymerase beta' chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate

Mol. Gen. Genet. 244:90-96(1994).

-!- FUNCTION: Fatty acid synthetase catalyzes the formation of long-chain fatty acids from acetyl-CoA, malonyl-CoA and NADPH.

The alpha subunit contains domains for: acyl carrier protein, loxoacyl-[acyl-carrier protein] synthase. This subunit coordinates the binding of the six beta subunits to the enzyme complex.
                                                                                                                                                                                                                                                                                                                                                                         SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                        diphosphate + L-aspartyl-tRNA(Asp).
-!- SUBUNIT: Homodimer (By similarity).
-!- SUBCELLUTAR LOCATION: Cytcoplasmic.
-!- SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.

01-NOV-1995 (Rel. 32, Last sequence update)
115-MAR-2004 (Rel. 43, Last annotation update)
Phosphatidylinositol-4,5-bisphosphate 3-kinase catalytic subunit, beta isoform (EC 2.7.1.153) (Pl3-kinase pl10 subunit beta) (Ptdins-3-kinase pl10) (Pl3K) (Pl3Kbeta).
                                                                                                           -i - CATALYTIC ACTIVITY: ATP + L-aspartate + tRNA(Asp) = AMP + diphosphate + L-aspartyl-tRNA(Asp).
-i - SUBUNIT: Homodimer (By similarity).
-i - SUBCELLULAR LOCATION: Cytoplasmic.
-i - SIMILARITY: Belongs to class-II aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TIGRFAMS; TIGRO0459; aspS bact; 1.

Natl. Acad. Sci. U.S.A. 100:9388-9393 (2003).

-!- FUNCTION: Associates with the EF-Tu.GDP complex and induces the exchange of GDP to GTP. It remains bound to the aminoacyl-tRNA.EF-Tu.GTP complex up to the GTP hydrolysis stage on the ribosome.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the EF-Ts family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FROM EF-

similarity).
CATALYTIC ACTIVITY: Release of an N-terminal amino acid, Xaa-|-Xbb-, in which Xaa is preferably Leu, but may be other amino acids including Pro although not Arg or Lys, and Xbb may be Pro.
COFACTOR: Binds 2 manganese ions per subunit (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
SIMILARITY: Belongs to peptidase family M17.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                     Nature 392:353-358(1998).
-1- FUNCTION: Presumably involved in the processing and regular turnover of intracellular proteins. Catalyzes the removal of unsubstituted N-terminal amino acids from various peptides (By
